Technical Data Modelling

Lecture 14
August 2022

Announcements

- Semester Test - 23 August
- Assignment – project guide, case study, requirements list and mark sheet
- Tutorial (pick up at IT Helpdesk)
- Practical

Content

- Technical ERD
 - Part 1: Referential Integrity
 - Part 2: Specify Data Types

Referential Integrity

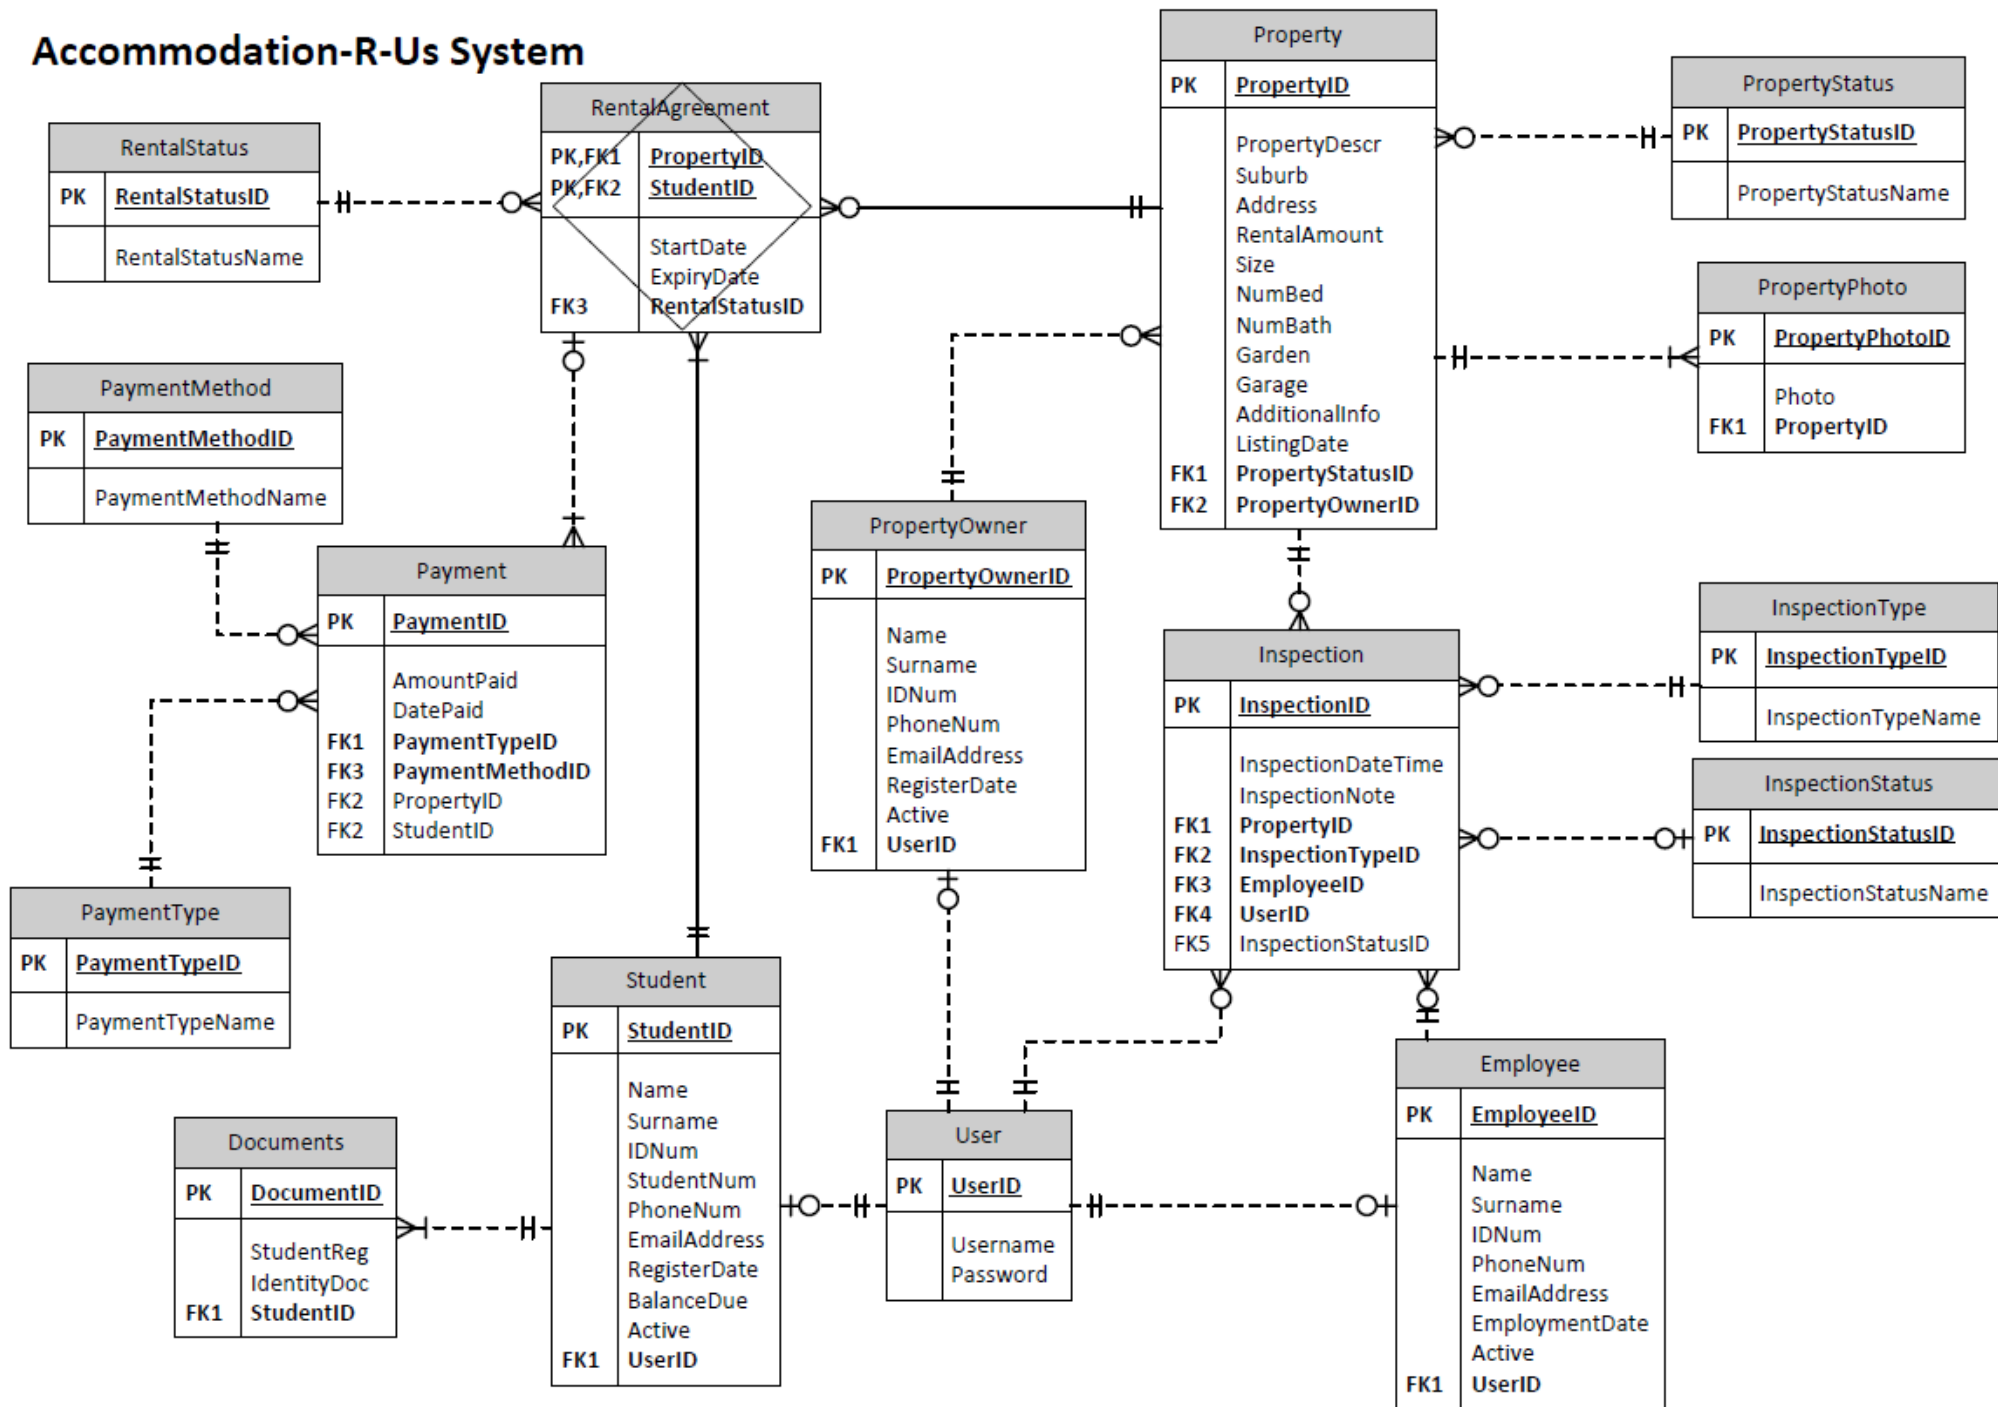

- Page 535 – 537 in Whitten and Bentley textbook
- **Key integrity** – every table should have a primary key (might be concatenated)
 - The PK must be unique to a record
 - In a concatenated key the combination of keys must be unique
 - The PK of a record may never be NULL (that would defeat the purpose of the PK – to identify unique record)
- **Domain integrity** – no field takes on a value outside the range of legal values. For example, a grade cannot have a negative value.
- **Relationships between tables** is established via **foreign keys**.
- **Referential integrity** error indicates that a foreign-key value in one table has no matching primary key value in the related table
 - An invoice table has the customer_id as a foreign key. If there is no customer table then you have compromised the referential integrity both the customer table and the invoice table.

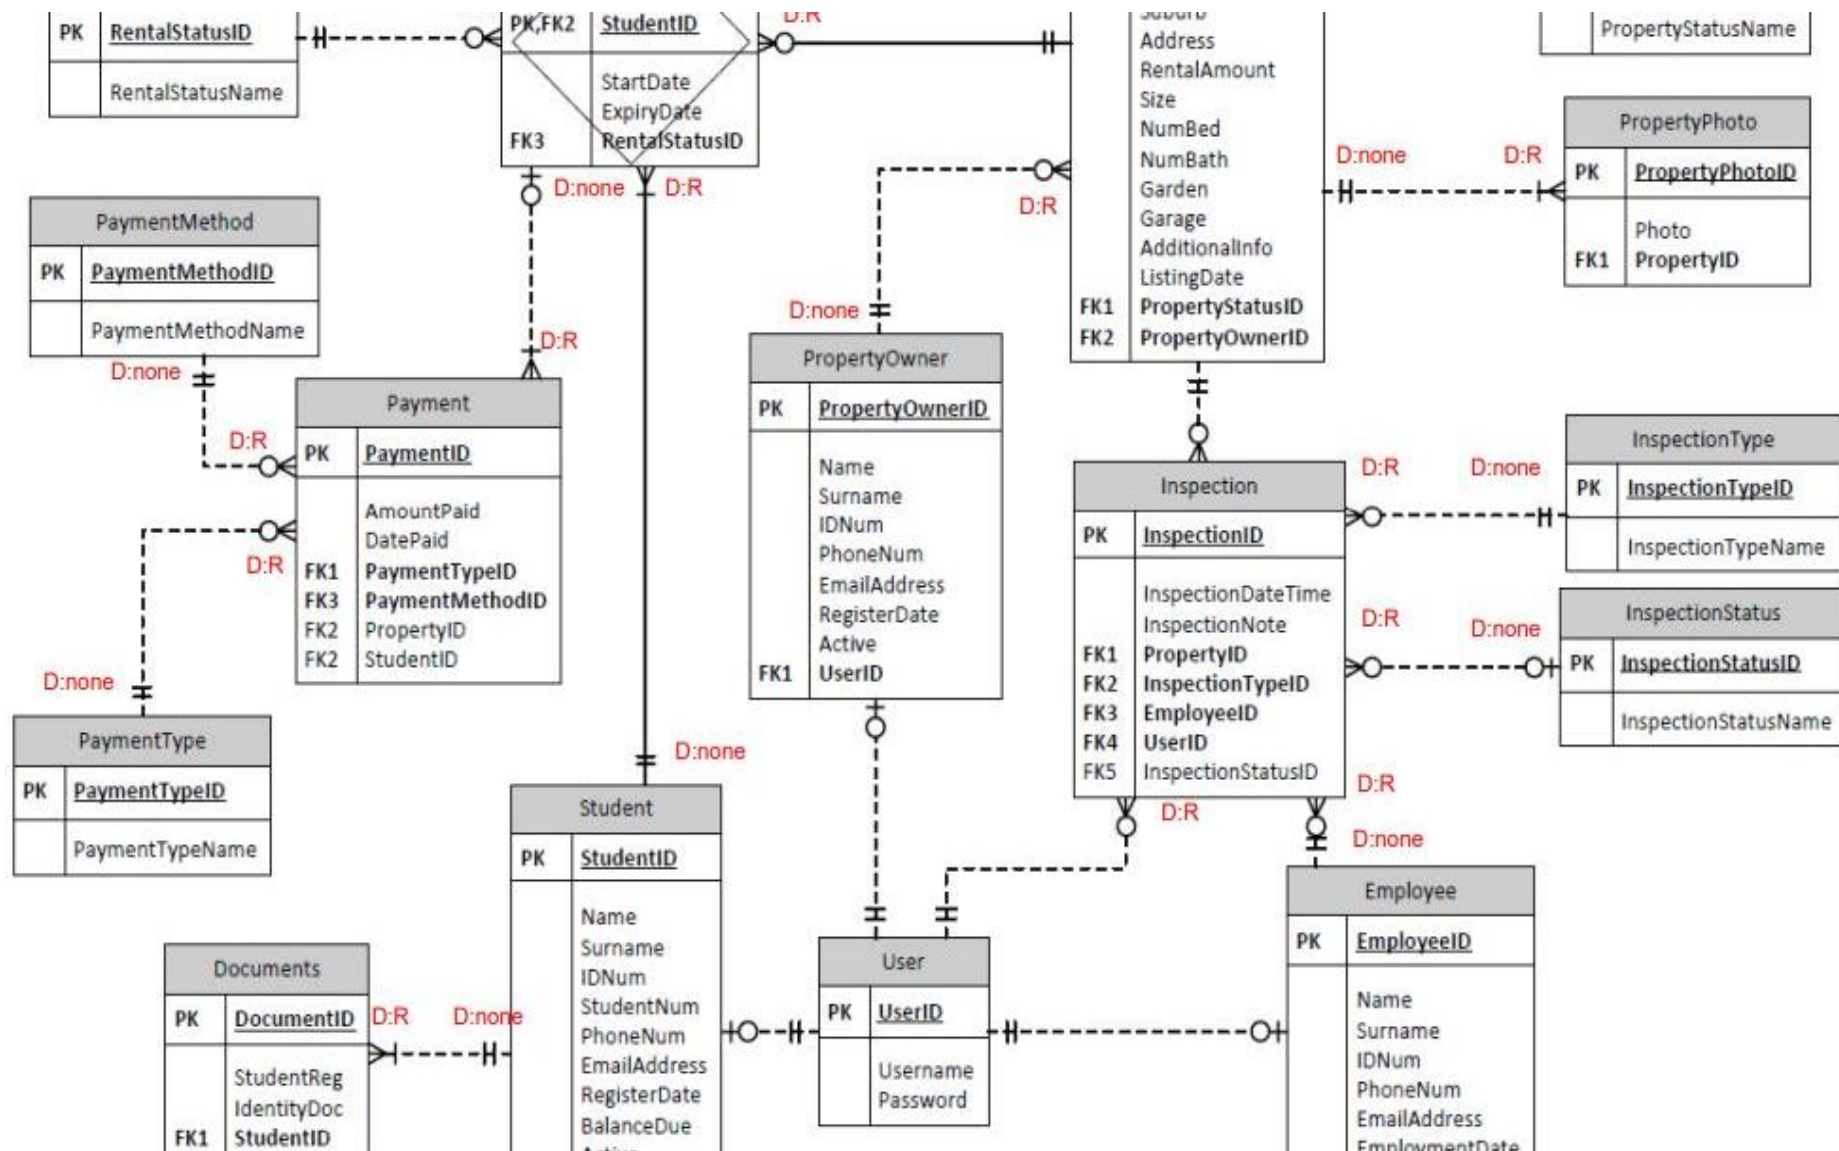

Referential Integrity

- Referential integrity is specified through deletion rules:
 - **No restriction** – any record can be deleted without regard to records in any other tables
 - **Delete cascade (D:C)** – A deletion of a record in the table must be automatically followed by the deletion of matching records in a related table.
 - **Delete restrict (D:R)** - A deletion of a record in the table must be disallowed until any matching records are delete from a table.
 - **Delete Set Null (D:SN)** – A deletion of a record in the table must be automatically followed by setting any matching keys in a related table to the value NULL.
 - *Usually only used if you want to keep records for historical reasons. By setting the FK to NULL you acknowledge that there is no corresponding master record.*

Delete None – Don't delete

Accommodation-R-Us System

ARU ERD with referential integrity

Part 2: Specify Data Types

Integer

Char

Boolean

Date/Time

Double (currency)
